

Materials Weekly: Process Notes and Field Reports

Curing ovens on line two now reach set temperature eleven minutes faster after the burner retrofit. Operators report steadier ramp profiles and fewer aborted cycles during cold starts.

The retrofit team credits the new insulation panels for most of the gain and will publish the full report next week.

Field crews in the northern region finished the seasonal inspection round three days ahead of plan. No structural findings were logged; two sites need minor sealant touch-ups.

Scheduling for the southern round opens on Monday and closes at the end of the month.

The materials lab validated the recycled feedstock blend at forty percent content without strength loss. Certification paperwork moves to the review board next.

A pilot production slot is reserved on line three pending board approval of the updated datasheet.
